

Patient-Centered Primary Care Collaborative Annual Review of the Evidence, 2014 – 2015 (Published February 2016)

This year's 30 publications point to a clear trend showing that the medical home drives reductions in health care costs and/or unnecessary utilization, such as emergency department (ED) visits, inpatient hospitalizations and hospital readmissions. Various approaches to PCMH payment that are highlighted show potential. Those with the most impressive cost and utilization outcomes were generally those who participated in multipayer collaboratives with specific incentives or performance measures linked to quality, utilization, patient engagement or cost savings. The more mature medical home programs demonstrated stronger improvements.
